Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/606,719

Applicant(s)

SANYAL, ANUPAM

Examiner

Cephia D. Toomer

Art Unit

1714

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on 02 March 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-10 and 16-21 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-10 and 16-21 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on March 2, 2007 has been entered.
2. This Office action is in response to the amendment filed March 2, 2007 in which claims 1 and 9 were amended and claims 17-21 were added.

Claim Rejections - 35 USC § 102

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1-6, 9-10 and 16-21 are rejected under 35 U.S.C. 102(e) as being anticipated by Johnson (US 6,729,248).

Johnson teaches additives for coal-fired furnaces wherein the additives include an iron compound such as ferrous and/or ferric oxides (see abstract and col. 3, lines 59-66). The coal is Powder River Basin coal (PRB) (high calcium content) (see col.2, lines 1-3, 46-49). Johnson teaches that the iron is present in amount of at least 0.5 wt % (see col. 10-15). Johnson teaches that the additive can be contacted with the coal feed

in a number of different ways, for example mixed with the coal feed at the shipping terminal, added to the coal reclaim belt or added to the coal bunkers (see col. 7, lines 15-21). Johnson teaches that his method provides for an effective system for enhancing combustion in cyclone furnaces. Johnson inherently teaches the claimed method because he teaches the same steps as those set forth in the present claims.

Accordingly, Johnson teaching all the limitations of the claims anticipates the claims.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 7 and 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Johnson (US 6,729,248).

Johnson has been discussed above. However, Johnson fails to teach that the coal and additive are ground. However, it would have been obvious to one of ordinary skill in the art to perform this step because it would ensure adequate mixing of the coal and additive.

Johnson fails to teach in the provisional application the proportions of claim 8. It would have been obvious to one of ordinary skill in the art at the time the invention was made to optimize the proportions of the iron compound through routine

Art Unit: 1714

experimentation for best results. As to optimization results, a patent will not be granted based upon the optimization of result effective variables when the optimization is obtained through routine experimentation unless there is a showing of unexpected results which properly rebuts the *prima facie* case of obviousness. See *In re Boesch*, 617 F.2d 272, 276, 205 USPQ 215, 219 (CCPA 1980). See also *In re Woodruff*, 919 F.2d 1575, 1578, 16 USPQ2d 1934, 1936-37 (Fed. Cir. 1990), and *In re Aller*, 220 F.2d 454, 456, 105 USPQ 233, 235 (CCPA 1955).

6. Claims 1-10, 17 and 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Buecker.

Buecker teaches using low-sulfur coal from Powder River Basin (PRB) as the primary fuel source for power plants. The coal is high in calcium. See page 1, first and fifth paragraphs. Buecker teaches that the coal handling facility contains a crusher granulator and this disclosure suggests that the coal is ground before use. See page 1, fourth paragraph). Buecker also teaches that the coal is combined with iron oxide (the skilled artisan would envisage ferric oxide) before it is burned and that the chemical enhances the characteristics of the slag (see page 2, last two paragraphs). Buecker teaches the limitations of the claims other than the differences that are discussed below.

In the first aspect, Buecker differs from the claims in that he does not specifically teach the claimed methods. However, no unobviousness is seen in this difference because Buecker teaches a coal composition that is similar to that of the present invention and he uses the coal composition in the same environment as Applicant.

Therefore, it would be reasonable to expect that the coal composition of Buecker would increase efficiency of heat transfer of a furnace, absent evidence to the contrary.

In the second aspect, Buecker differs from the claims in that he does not specifically teach that the furnace exit gas temperature is reduced. However, it would be reasonable to expect that the temperature would be reduced since Buecker teaches a coal composition that is similar to that of the present invention and he uses the coal composition in the same environment as Applicant.

7. Claims 1-10 and 16-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Radway (US 5,819,672).

Radway teaches treating coal with a darkening agent wherein the darkening agent is iron oxide (the skilled artisan readily envisages ferric oxide)(see abstract; col. 3, lines 15-32; example 1). Radway uses PRB coals which are known for their high calcium content (see col. 2, lines 42-49; example 1). Since Radway teaches that the darkening agent may be a solid it is implied that the coal/agent may be ground, especially in view of Radway teaching that the agent may be applied in any appropriate fashion (see col. 3, lines 60-64). Radway teaches the limitations of the claims other than the differences that are discussed below.

In the first aspect, Radway differs from the claims in that he does not specifically teach the claimed methods. However, no unobviousness is seen in this difference because Radway teaches a coal composition that is similar to that of the present invention and he uses the coal composition in the same environment as Applicant.

Therefore, it would be reasonable to expect that the coal composition of Radway would increase efficiency of heat transfer of a furnace.

In the second aspect, Radway differs from the claims in that he does not specifically teach that the furnace exit gas temperature is reduced. However, it would be reasonable to expect that the temperature would be reduced since Radway teaches a coal composition that is similar to that of the present invention and he uses the coal composition in the same environment as Applicant.

8. Applicant's arguments have been fully considered but they are not persuasive.

Applicant argues that Johnson teaches a fluxing agent. Applicant is under the impression that the examiner implied that Johnson did teach a fluxing agent and that by amending the claims to state the absence of such an agent would overcome the reference.

The examiner did not mean to imply that zinc oxide, as used in Johnson, is a fluxing agent. Applicant has provided no support for the use of this compound as a fluxing agent and Johnson does not require the presence of this compound. For instance, see claim 1 of Johnson.

The examiner agrees with Applicant's definition of the transition language "consist essentially of". However, there is nothing in the Johnson reference that would effect the novel and basic characteristics of the present invention because Johnson does not teach fluxing agents.

Applicant argues that Johnson does not mention soot blowers or water lances. Applicant argues that Johnson does not teach the newly added limitations of ash or

increased melting point and ash that is darker than ash that is produced in the absence of the claimed composition.

The examiner agrees that Johnson does not mention soot blowers or water lances. Therefore, Johnson meets the claimed limitations. Johnson teaches the same composition as set forth in the present invention and it would inherently meet the newly added limitations with respect to the ash.

Buecker is maintained for the reasons of record since Applicant has not established that zinc is a fluxing agent.

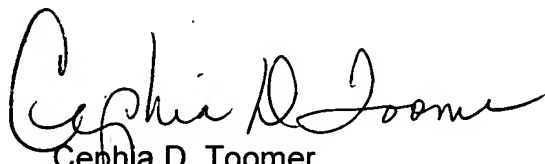

The examiner has considered Applicant's arguments regarding Radway. Radway sets forth that the fluxing agent is not required. While he may use it in his example, it is well settled that the reference is not limited to the examples therein but to all that it teaches. Radway teaches that his invention may be practiced in the absence of a fluxing agent.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Cephia D. Toomer whose telephone number is 571-272-1126. The examiner can normally be reached on Monday-Thursday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Vasu Jagannathan can be reached on 571-272-1119. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
